

Converged Security + Information Management

ENVIRONMENT

Educational Institutions are dynamic environments with complex security infrastructures. Several notable events in the past several years have underscored the vulnerability of educational campuses, and they remain targets for violence and other emergencies. Campus security professionals must be prepared to respond quickly to events, and this requires the ability to leverage security technology in an open environment. A critical security issue in a campus environment can result in tragic circumstances, and negative economic impact on surrounding communities.

SECURITY CHALLENGES:

- Controlling disparate systems and sensors
- Preventing access to unauthorized areas
- Achieving real-time visibility to operational malfunctions or malicious threats
- Comprehensive and effective monitoring of geographically dispersed assets

VIDSYS SOLUTION

Vidsys is a rapidly deployable, browser-based platform that collects, correlates and converts vast amounts of data into meaningful and actionable information, based on the organization's risk policy, standards and compliance requirements.

Vidsys software enables decision makers from a single organization or multiple entities – however geographically dispersed – to manage risk in real time. By leveraging mobile and web-based technology, the software can be rapidly deployed and provides real-time situational awareness and information management capabilities to remote users and first responders.

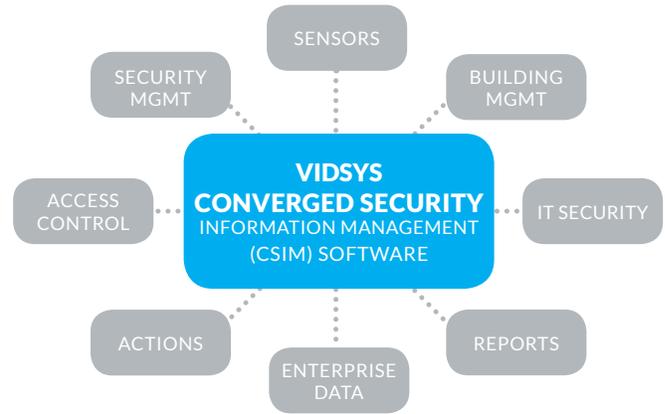

Because Vidsys uses open architecture it can integrate to any system or product. Vidsys software meets all US federal information assurance requirements.

BENEFITS

- Manage geographically dispersed assets from a single location
- Improve response times
- Improve collaboration and resource sharing
- Facilitate interoperability – among public agencies and within large organizations
- Integrate to virtually any system
- Reduce operating costs
- Extend technology investment lifecycle

HOLISTIC SECURITY AND RISK MANAGEMENT

- Commercial-off-the-shelf (COTS) software
- Open architecture – integrates any system or product
- Rapidly deployable, browser-based client
- Meets US federal information assurance requirements
- Mobile and Scalable

HOW IT WORKS

The Vidsys software platform has a rules engine and work flow tools that give end users the ability to pre-determine what data should be correlated and what should be filtered out. For example, from a video analytics alert, a command center operator can be instantaneously presented with the exact location of the potential security breach and surrounding assets on a map, along with step-by-step instructions for evaluation and resolution. This includes pushing crucial information such as video camera views through a mobile interface to a responding officer. The dynamic reporting feature can generate detailed reports for after action analysis or as part of a forensic record.

In another scenario, if a person with criminal intent is identified on campus, Vidsys software integrates all the relevant information including video assets, access control systems, mass notification and event management for security responders. Alarms are correlated while live and recorded video feeds from the cameras closest to the alarm are automatically displayed. PSIM software can assist responders in identifying and resolving the situation quickly and efficiently any time of day or night.
